Fresh Milk

(Fat content - 1,5%, 2,3%, 3,1%, 6%)

Pasteurized fresh milk is made from whole cow milk without any preservatives by ultra heat treatment method (UHT). Under this technology fresh milk is homogenized ensuring non-separation of fat fraction and then quickly heated to 135-140°C for 4 sec only. Then it is immediately chilled to room temperature. The whole process goes inside isolated sterile system that guarantees protection from undesirable exposure.

Tetra Brick Aseptic package efficiently protects milk against light, oxygen and bacteria and allows to keep natural milk taste, color and nutrition value without any preservatives for several months even at room temperature.

Pasteurized milk does not require boiling and is ideal both for children and adults.

Storage: at T from +2 to +25°C

Packaging - Tetra Brick Aseptic

Load in 40'ref: 23000 packages

Package volume - 1L

Packages in one case - 12 pieces

Gross weight of a packing case: 12.9 kg
